

# Things to work on

- start with a one-liner on the purpose of the study
- follow-up is not the duration of the study but rather how many people were “lost” to follow-up
- present who ultimately ended up in the study (baseline characteristics)  
NOT the inclusion/exclusion criteria
- don't forget the harms/side effects
- if it is not stat sign then don't calculate NNT/NNH
- comment on conflicts of interest

## **ADDITIONAL TASK**

at the end, based on the findings, each member of the group needs to make a decision as to what they would “take” and how they would start the treatment - assuming they were like the ‘AVERAGE’ person in the study
